

# Java Nuances

---

## General Tips:

---

- Getter and setter
- Override and super
- Java automatically collects garbage
- &&/|| checks left first
- + strings makes a new string every time, if you want to do in a loop use stringBuilder(reduce memory)
- Everything in Java not explicitly set to something, is initialized to a zero value
  - references (anything that holds an object):null
  - int/short/byte:0
  - float/double:0.0
  - booleans: false.
  - array of something, all entries are also zeroed

---

## Useful built in functions:

---

- Arrays
  - Arrays.binarySearch(arr, target)
    - \* Negative value shows where it should be
  - Arrays.sort(arr)

---

## Switch Statement:

---

- All matching cases will be run unless there is a break statement
- Example

---

```
switch (month) {  
    case 1: monthString = "January";  
        break;  
    case 2: monthString = "February";  
        break;  
    case 3: monthString = "March";  
        break;
```

```
        case 4: monthString = "April";
                break;
        case 5: monthString = "May";
                break;
        case 6: monthString = "June";
                break;
        case 7: monthString = "July";
                break;
        case 8: monthString = "August";
                break;
        case 9: monthString = "September";
                break;
        case 10: monthString = "October";
                break;
        case 11: monthString = "November";
                break;
        case 12: monthString = "December";
                break;
        default: monthString = "Invalid month";
                break;
    }
```

---

---

### Breaking out of for loops:

---

- if you want to skip a particular iteration, use continue

```
for(int i=0 ; i<5 ; i++){

    if (i==2){

        continue;
    }
}
```

---

- if you want to break out of the immediate loop use break

```
for(int i=0 ; i<5 ; i++){

    if (i==2){

        break;
    }
}
```

---

- if there are 2 loop, outer and inner.... and you want to break out of both the loop from the inner loop, use break with label

---

```
lab1: for(int j=0 ; j<5 ; j++){  
    for(int i=0 ; i<5 ; i++){  
  
        if (i==2){  
            break lab1;  
        }  
    }  
}
```

---

---

### Generics:

---

- Definition
  - generics are a facility of generic programming
    - \* a style of computer programming in which algorithms are written in terms of types to-be-specified-later that are then instantiated when needed for specific types provided as parameters
  - ex: compiletime: List<String>, runtime: List
- Notes
  - in java, generics are only checked at compile time for type correctness
  - generic type information is then removed via a process called type erasure, to maintain compatibility with old JVM implementations, making it unavailable at runtime
- Sources
  - [https://en.wikipedia.org/wiki/Generics\\_in\\_Java](https://en.wikipedia.org/wiki/Generics_in_Java)

---

### Type Classifications:

---

- Concrete Types
  - concrete types describe object implementations, including memory layout and the code executed upon method invocation
  - the exact class of which an object is an instance not the more general set of the class and its subclasses
  - beware of falling into the trap of thinking that all concrete types are single classes!
  - Set of Exact Classes
  - ex: List x has concrete type ArrayList, LinkedList, ...
- Abstract Types
  - Abstract types, on the other hand, describe properties of objects

- They do not distinguish between different implementations of the same behavior
- Java provides abstract types in the form of interfaces, which list the fields and operations that implementations must support

---

### Access Modifiers:

---

- public
  - any class can access
  - accessible by entire application
- private
  - only accessible within the class
- protected
  - allow the class itself to access them
  - classes inside of the same package to access them
  - subclasses of that class to access them
- package protected
  - default
  - the same class and any class in the same package has access
  - protected minus the subclass unless subclass is in package
- Static: Belongs to class not an instance of the class

---

### Things to override in new object (for hashing and equality uses):

---

- public int hashCode()
- public boolean equals(Object object)

---

```
ex: Tiger
@Override
public boolean equals(Object object) {
    boolean result = false;
    if (object == null || object.getClass() != getClass()) {
        result = false;
    } else {
        Tiger tiger = (Tiger) object;
        if (this.color == tiger.getColor()
            && this.stripePattern == tiger.getStripePattern()) {
```

```
        result = true;
    }
}
return result;
}
```

---
